Not illustrated. 1845 Excerpt: . the sun, and through E imagine the rectangular co-ordinate axes EX, EY, Ez to be drawn, of which Ex and Ey are in the plane of the ecliptic, and the former passes through the equinoctial point T. Imagine S to be the place of a spot on the sun s disk, and s its orthographical projection on the plane of the ecliptic: again, let the co-ordinates Ex, EY of the point S be represented by x and Y, and ES by R; then since the angle T E S, the sun s longitude, is represented by L, we have $x = R \cos L$, $Y = R \sin L$. Let now Es be represented by r; also let the co-ordinates EX, EY, S s of the spot S be represented by x, y, z; then Tes, the geocentric longitude of S, being represented by-Z, and S E s, the geocentric latitude, by X, we have, as in art. 184., $x = r \cos. X \cos. l$, $y = r \cos. X \sin. l$, and $z = r \sin. X$. Lastly, let the three rectangular co-ordinates of S, with respect to S, be x ($--sx$) $y = (sy)$ and $z = (S s)$, and let the semidiameter s S of the sun be represented by r : then, $x --x--X$, and $y --y--Y$; and in these equations substituting the above values, we have for the equivalents of x, y...
